

❓ Fake Job/Internship Detection Portal

□ Project Overview

The **Fake Job/Internship Detection Portal** is a web-based application designed to help students and job seekers identify potentially fake, fraudulent, or suspicious job and internship opportunities.

The system analyzes job and internship information, identifies common warning signs, provides a risk assessment, and gives users safety recommendations before they apply.

The application was developed using **Base44 AI**, an AI-powered application development platform that can generate functional web applications from natural-language requirements.

□ Live Application:

<https://tidy-job-guard-pro.base44.app>

□ Problem Statement

With the increasing use of online platforms for job and internship recruitment, students and job seekers are frequently exposed to fraudulent opportunities.

Fake job postings may:

- Promise unrealistically high salaries
- Ask candidates to pay registration or training fees
- Request sensitive personal information
- Use suspicious email addresses
- Provide incomplete company information
- Create unnecessary urgency
- Redirect users to suspicious application links
- Make unrealistic work-from-home promises

Many students, especially fresh graduates, may find it difficult to identify these warning signs.

Therefore, this project aims to provide a simple web-based solution that helps users evaluate job and internship opportunities and make safer decisions.

□ Proposed Solution

The proposed system allows users to enter job or internship details into the portal.

The application analyzes the submitted information and identifies suspicious indicators.

It then provides:

- Risk Score
- Risk Level
- Detected Warning Signs
- Positive Indicators
- Safety Recommendations
- Company Verification Information

The system is intended to work as an **early-warning and awareness tool**, not as a guaranteed fraud detector.

□ Objectives

The main objectives of the project are:

1. To help students identify potentially fake job and internship opportunities.
 2. To analyze job descriptions for common scam indicators.
 3. To provide an understandable risk assessment.
 4. To educate users about common recruitment scams.
 5. To encourage users to verify companies before applying.
 6. To provide a centralized platform for reporting suspicious opportunities.
 7. To demonstrate the use of AI-assisted application development using Base44.
-

□ Key Features

1. Job/Internship Analysis

Users can submit information such as:

- Job title
- Company name
- Job description
- Salary/Stipend
- Location
- Recruiter information
- Contact information
- Application URL

The system analyzes the provided information and identifies possible warning signs.

2. Risk Score

The application generates a risk score between **0 and 100**.

Score	Risk Level
0–30	☐ Low Risk
31–60	☐ Medium Risk
61–80	☐ High Risk
81–100	☐ Very High Risk

The system also explains why a particular risk level was assigned.

3. Suspicious Pattern Detection

The application checks for indicators such as:

- Requests for payment
 - Unrealistic salary promises
 - Urgent application requests
 - Suspicious email addresses
 - Missing company information
 - Suspicious application links
 - Requests for sensitive information
 - Poor or unusual job descriptions
 - Unofficial communication channels
-

4. Company Verification

Users can enter company information to perform a basic verification assessment.

The system can display statuses such as:

- ☐ Verified
- ☐ Needs Verification
- ☐ Suspicious

The result should be treated as an assessment rather than definitive proof that a company is legitimate or fraudulent.

5. Suspicious Job Reporting

Users can report potentially fraudulent job or internship postings.

Users can provide:

- Company name
- Job title
- Job URL
- Description
- Reason for reporting
- Supporting evidence

This feature helps create a database of reported suspicious opportunities.

6. User Dashboard

The dashboard can display:

- Total jobs checked
 - High-risk jobs
 - Recent analyses
 - Saved jobs
 - Company verification results
 - Previous reports
-

7. Safety Tips

The application provides educational information about:

- Common job scams
 - Internship scams
 - Fake recruiter behavior
 - Payment scams
 - Safe job-search practices
 - Company verification
 - Information that should not be shared
-

□ System Architecture

The application follows a web application architecture consisting of:

Base44 provides capabilities for building application interfaces, backend logic, database functionality, authentication, and deployment from a unified platform.

□ Technologies Used

Development Platform

Base44 AI

Used for:

- Application generation
- UI development
- Backend functionality
- Database management
- Application deployment
- AI-assisted development

Base44 describes its platform as an AI app builder capable of creating functional applications with screens, data, backend logic, authentication, permissions, integrations, and deployment.

Application Type

- Web Application
- Responsive UI
- AI-assisted development

- Cloud-based deployment
-

□ **Functional Modules**

User Module

- User registration
- Login
- Profile management
- Job analysis
- Company verification
- Report submission
- Analysis history

Job Analysis Module

- Job information input
- Description analysis
- Suspicious pattern detection
- Risk calculation
- Risk explanation
- Safety recommendation

Company Module

- Company search/input
- Verification assessment
- Trust information
- Suspicious reports

Report Module

- Report suspicious job
- Submit evidence
- Track reports

Admin Module

- View reports
 - Review suspicious jobs
 - Manage company information
 - Monitor application statistics
-

□ **Working Process**

Step 1
User opens the portal
↓
Step 2
User enters job/internship details
↓
Step 3
System analyzes the submitted information
↓
Step 4
Suspicious patterns are identified
↓
Step 5
Risk score is generated
↓
Step 6
Risk level and reasons are displayed
↓
Step 7
User receives safety recommendations
↓
Step 8
User decides whether to proceed with the opportunity

□ AI-Based Analysis

The application uses AI-assisted analysis to examine job descriptions and identify potentially suspicious characteristics.

For example, a job posting containing:

"Earn ₹50,000 per week from home. Pay ₹2,000 registration fee to start immediately."

may trigger multiple warning indicators:

- Unrealistic earning claim
- Registration fee request
- Urgency
- Lack of detailed company information

The system can therefore assign a higher risk level.

Important: The AI assessment should not be considered conclusive evidence that a job is fraudulent.

□ Security & Privacy

The application follows basic security and privacy principles.

Important practices include:

- Avoid collecting unnecessary sensitive information.
 - Never request passwords or OTPs.
 - Do not request banking credentials.
 - Protect user account information.
 - Clearly distinguish AI assessments from verified information.
 - Provide appropriate warnings before users share sensitive data.
-

□ User Interface

The application contains a simple and user-friendly interface designed for students and job seekers.

Main Navigation

□ Testing

The application should be tested using different types of job postings.

Test Case 1 – Normal Job

Input:

A job with realistic salary, official company details, professional description, and legitimate contact information.

Expected Result:

Low or medium risk.

Test Case 2 – Registration Fee

Input:

Job requires candidates to pay a registration fee.

Expected Result:

High-risk warning.

Test Case 3 – Unrealistic Salary

Input:

Very high salary with little experience or qualification required.

Expected Result:

Suspicious indicator detected.

Test Case 4 – Suspicious Email

Input:

Recruiter uses an unofficial or suspicious email address.

Expected Result:

Warning generated.

Test Case 5 – Multiple Warning Signs

Input:

Job contains payment requests, unrealistic salary, urgency, and suspicious contact information.

Expected Result:

Very High Risk.

☐ **Advantages**

- Easy to use
- Useful for students and fresh graduates
- Provides quick risk assessment
- Helps improve cybersecurity awareness
- Identifies common recruitment scam patterns
- Centralizes suspicious job reporting
- Can be accessed through a web browser
- Developed rapidly using AI-assisted application development

☐ **Limitations**

- AI predictions may not always be accurate.
- A low-risk score does not guarantee that a job is genuine.
- Company verification may depend on available information.
- Some sophisticated scams may not be detected.
- Internet-based company information may change over time.

- The system should be used as a supporting tool rather than the only source of verification.
-

□ **Future Enhancements**

The project can be improved with:

1. Real-time company verification.
 2. Integration with trusted job portals.
 3. Advanced NLP-based scam detection.
 4. Machine-learning-based fraud classification.
 5. Browser extension for checking job postings.
 6. Email scam detection.
 7. AI chatbot for recruitment safety questions.
 8. Community-based reputation scores.
 9. Automated suspicious URL analysis.
 10. Multilingual support for Indian languages.
 11. Mobile application.
 12. Improved evidence-based fraud reporting.
-

□ **Social Impact**

The project aims to improve awareness among:

- College students
- Fresh graduates
- Job seekers
- Internship applicants

By identifying common warning signs before users apply or make payments, the platform can help reduce exposure to recruitment scams.

□ **Learning Outcomes**

Through this project, students can gain experience in:

- Web application development
- AI-assisted development
- Prompt engineering
- Database concepts
- User authentication
- UI/UX design

- Cybersecurity awareness
 - Risk assessment
 - Software testing
 - Cloud deployment
 - GitHub project documentation
-

□ Why Base44 AI?

Base44 was selected because it enables developers to describe application requirements using natural language and generate a functional web application. It also supports backend functionality, databases, authentication, and deployment, which makes it suitable for rapidly developing and demonstrating a mini project.

The project demonstrates how AI-assisted development can be used to convert a real-world problem statement into a working web application.

☐ ☐ **Project Information**

Project Title:

Fake Job/Internship Detection Portal

Project Type:

Mini Project

Domain:

Web Development / Artificial Intelligence / Cybersecurity

Development Platform:

Base44 AI

Target Users:

Students, Fresh Graduates and Job Seekers

☐ **Disclaimer**

This application is designed for educational and awareness purposes. The risk score and AI-generated analysis are indicators only and should not be treated as definitive proof that a job, internship, recruiter, or company is fraudulent or legitimate.

Users should independently verify employment opportunities through official company websites and trusted sources before sharing personal information or making payments.

☐ **Conclusion**

The **Fake Job/Internship Detection Portal** provides a practical solution to an important problem faced by students and job seekers. By combining AI-assisted analysis, risk assessment, company verification, reporting, and cybersecurity awareness, the application helps users make more informed decisions about online employment opportunities.

The project also demonstrates how **Base44 AI** can be used to rapidly transform a real-world problem statement into a functional web application.
